

## Title: Google Street View, a Virtual Orienteering Experience

Orienteering has always been a fun experience for students. However, it tends to be limiting as orienteering is often only practised in school – an environment which they are all too familiar with.

During the implementation of Full Home-Based Learning, the usage of Google Street View allowed us to expand the orienteering experience beyond the school, to other parts of Singapore and even the world! Google Street View allows students to move in any direction to get to checkpoints. Students will need to identify the cardinal points in which they have to travel and identify their sense of place by virtually observing the surroundings and locating their position on the map. The application of Google Street View in online lessons is very flexible as teachers can scale the experience of students based on their ability.
